

# BBS System Use Case

A **bulletin board system** (abbreviated as **BBS**) is a computer server that runs software that allows users to connect to the system via a terminal program. Once logged in, the user can do things like upload and download software and data, read news and bulletins, and communicate with other users via public message boards and direct chatting. Message networks like FidoNet were created in the early 1980s to provide services like NetMail, which is akin to internet-based email.

If you need to create a **bbs system use case diagram**, you can start from this ready-made template in **EdrawMax**. Our professionally designed use case diagram templates will help you get ideas for your own use case diagrams design.
